

The included python software makes the use of some libraries/modules which are generally widely used. Following is a list of all the libraries used. An updated version of these libraries are required to compile and run the python program :

1. numpy
2. yfinance
3. tkinter
4. matplotlib

On a Linux or Mac environment the following command on the command line will install any of these libraries if they are not already installed. Replace the library_name with the actual name

```
`python3 -m pip install library_name`
```

The simplest way to see all installed packages and modules is with the following command

```
`python3 -m pip list`
```

If a permission error occurs while the install of any of the modules. Adding the `sudo` keyword in front of the command will do the trick.

-----RUN-----

Finally to run the program, the best way is to run from command line via the following command

```
`python3 main.py`
```

Thank you :)
